

ABSTRACT OF THE DISCLOSURE

A digital still camera is provided with a freely rotatably dial. The camera has a liquid crystal display screen provided on its back and the screen displays film borders. A thumbnail image corresponding to main image data that has been recorded on a memory card is displayed in a thumbnail image border within the film borders. By rotating the dial, the film borders are moved so that a desired thumbnail image becomes enclosed by a designating frame. When the thumbnail image is enclosed by the designating frame, the main image is displayed an area. When a blank area is enclosed by the designating frame, the main image data can be recorded on the memory card. Operability is facilitated because recording, playback and designation of a frame to be played back can all be performed in accordance with rotation of the dial.
